

Lesson Plan

Opening Soon!

An exciting way to introduce classroom materials and learning areas slowly, safely, and with a sense of ownership and fun.

By Lynn Bechtel

As eager kindergarten students enter the classroom on the first day of school, they see chairs and tables, a paper towel machine, a row of hooks for backpacks, and shelves full of brightly wrapped boxes. Certain areas of the room are hidden behind colorful curtains and tantalizing signs that read "Opening Soon!" For the first few days of school, the wrapped boxes and curtained work areas remain things of mystery for the children.

Such is the scene in veteran kindergarten teacher Rick Ellis's classroom at Dutch Neck School in Princeton Junction, New Jersey. "The only things visible in my kindergarten classroom are things I know we'll need to use right away," says Rick.

Rick's approach — drawing on Responsive Classroom® strategies defined in the book *The First Six Weeks of School* (see below) — is not unusual. Around the country, many teachers at all grade levels use the first days and weeks of school to introduce routines, materials, and learning areas in a structured way.

Meeting and Greeting Materials

After the first week of school, once children seem comfortable with a few routines, Rick slowly unveils the hidden classroom areas — the classroom library; the art center with supplies hidden under colorful, gift-wrapped boxes; and the curtained-off block bins.

It's important, says Rick, to set a tone of excitement. "I want children to think that everything about school is wonderful," he says, "so instead of just saying, 'Here's where the pencils belong,' I present the magic pencil box and spend time exploring how to use the pencils."

During each introduction, Rick goes through the following steps:

After revealing the hidden material or work area in a way that stimulates curiosity and excitement (like shaking a gift-wrapped box of crayons and asking the children to guess what's inside), he encourages the children to talk about what they already know about the material or work area.

He and the children brainstorm new ways to use the material or work area. For example, Rick might ask the children to offer suggestions for using colored construction paper. The children call out their ideas: "We could put it on our display board!"; "We could cut out shapes of animals or people!"; "We could draw on it!" Rick first models safe use and care and then gives the children an opportunity to try out some of the ideas *on the list*.

After the children share what they've worked on, Rick models how to clean up; the children practice. Later, he supervises independent use of the material or area.

"Can-Do" Kids

One compelling reason for opening up the room slowly is safety. Says Rick: "I don't want curious and excited five-year-olds running into the room and grabbing a handful of crayons or playing with the scissors until we've had a chance to talk about how to use these things safely."

A careful introduction of materials and learning areas also reinforces their importance. "If I take time introducing a material, whether it's a pair of scissors or a computer," Rick says, "the children will better understand its value. And if I allow time for the children to explore its potential uses, they feel a sense of ownership and are more likely to use it both creatively and responsibly."

With primary grades, introduce tools such as pencils and rulers that don't require a lot of cleanup or self-control. Once children can use simple materials safely, begin to introduce materials and areas that require more self-control. Rick describes this process as "letting the kite string out slowly." He usually opens the building-block area last since it involves knowing "how to share, control your body in space, build safely, and clean up."

Although older students will already be familiar with many materials and learning areas, they will also benefit from a review of procedures. They might explore different ways to use familiar materials, which have new uses as students advance.

"It's important to create 'can-do' kids who know how to be safe in the classroom and use tools and areas independently," Rick says. "When teachers take the time to do this," he continues, "they can then spend their time teaching rather than putting out fires all day."
